

Technical Skills

Distributed Systems, Rust, Golang, Typescript, Postgres, Clickhouse, React, React Native

Education

Bachelor of Computer Science
University of Waterloo – Dean's Honor List

Graduated May 2018

Work Experience

Dolores Park Labs (dba Blackwing)
Co-founder / CTO

Brooklyn, New York / Seattle, Washington
November 2022 – November 2025

- Led implementation of realtime Solana indexer with $\leq 1s$ p99 e2e latency for non-trivial materialized views
- Led implementation of Solana order execution engine, with $\sim 400ms$ confirmation latency
- Led research around training various memecoin trading models
- Designed Limitless Pools, a novel mechanism for leverage trading. Launch waitlist grew to \$70m in deposits.
- Led team of 7 engineers to implement and launch above initiatives
- Founder stuff: key contributor in hiring, product planning, and other day to day operations of the company

Robinhood
Staff Software Engineer – Various Teams

Menlo Park, California / Seattle, Washington
September 2017 – April 2022 (incl time to graduate)

- 1 of 3 founding members of Trading Platform team, responsible for handling all of Robinhood's orderflow
 - Helped scale system to handle billions of dollars of daily trading volume
 - Grew team to an org of 60+ people and multiple subteams
- Led cross functional team of 10+ engineers to build and launch Fractional Trading
 - Designed JIT inventory management system which minimized financial risk to the company
 - Orchestrated deployment of significant rewrites to critical systems while minimizing risk
- Spearheaded efforts to improve the experience of deploying and operating postgres databases via kubernetes
- Led and contributed responses to potentially company ending incidents
 - Contributed to identifying and implementing remediations to reduce operational and engineering risk as Robinhood matured from a 100 person startup to a multi thousand person public company

Facebook
Software Engineering Intern – Ads Attribution

Seattle, Washington
May 2017 – September 2017

- Built table component capable of showing large amounts of data for ads attribution dashboard
 - Improved page load times by 10x by reducing number of unnecessary DOM rewrites
 - Implemented complex table features (sorting, filtering, etc) for data sets with 100s of millions of rows

Stripe
Software Engineering Intern – Risk

San Francisco, California
May 2016 – August 2016

- Aggregated gigabytes of platform fraud data using Scalding and realtime charge data using Storm
 - Exposed data on underwriting dashboard, helping reduce monthly losses by thousands of dollars
- Developed Futures - a database persisted, promise-like data structure
 - Provided better code organization around long lived asynchronous processes
 - Used in production to schedule actions after a fraud review is raised on a merchant
